Final Examination - April 23, 1998

Time: 3 hours

Instructor: D.E. Dodds

All texts, handout notes and personal notes are permitted.  
 Photo or electronic copies of problem and exam solutions are not permitted.

Complete 5 (out of 6) questions - all questions have value 12 points

Where possible, use the space below each question for your answer.

Use the reverse side of the previous page for additional work.

Hand in your entire question paper; do not separate the pages.

1(a) Determine the peak, peak-to-peak, average, and RMS values of  $x(t)$  and  $y(t)$ . Also determine the first six coefficients of the Fourier series approximation to  $y(t)$ .

$$x(t) = 7v \cos 2\pi 400t$$

V <sub>p</sub> Volts	V <sub>p-p</sub> Volts	V <sub>ave</sub> Volts	V <sub>rms</sub> Volts	P <sub>N</sub> Watts	f <sub>0</sub> Hz	T <sub>0</sub> ms	C <sub>±5</sub> Volts	C <sub>±4</sub> Volts	C <sub>±3</sub> Volts	C <sub>±2</sub> Volts	C <sub>±1</sub> Volts	C <sub>0</sub> Volts
7	14	0	4.95	24.5	400	2.5	0	0	0	0	3.5	0
1	2	-0.5	1	1	25	40	-0.09	0	.150	0.32	0.45	0.5

$$C_N = A \left( \frac{\pi}{T_0} \right) \sin \left( n \pi \left( \frac{\pi}{T_0} \right) \right)$$

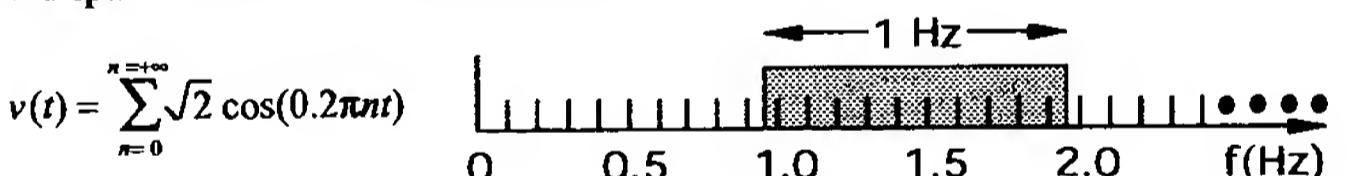

$$= 2 \left( \frac{10}{40} \right) \sin \left( n \pi \left( \frac{1}{40} \right) \right)$$

1(b) Determine a polar "trigonometric" Fourier series approximation to the signal  $y(t)$  and verify your calculation using Parseval's theorem.

$$y(t) = 0.5 + 0.9 \cos(2\pi 35t) + 0.64 \cos(2\pi 80t) + 0.3 \cos(2\pi 75t) = 0.5$$

$$P_N = (0.5)^2 + \frac{(0.9)^2}{2} + \frac{(0.64)^2}{2} + \frac{(0.3)^2}{2} = 0.921$$

1(c) A noise-like signal,  $v(t)$ , is composed of sinusoidal components each with amplitude 1 mVrms and spaced at one tenth Hertz intervals.

(i) The noise-like signal passes through a filter with bandwidth one Hertz. What is the rms voltage and the normalized power of the filter output signal?

$$1 \text{ mW} \cdot 10 \text{ peaks} = 10 \text{ mW} \quad V_{RMS} = 3.16 \text{ mV}$$

(ii) What is the filter output rms voltage and normalized power if the filter has 30 Hz bandwidth?

$$30 \cdot 10 \cdot 4 = 300 \text{ mW}$$

$$V_{RMS} = 17.3 \text{ mV}$$

(iii) Determine the power spectral density (PSD) and the amplitude spectral density of the noise-like signal.  $PSD = \frac{10 \text{ mW}}{1 \text{ Hz}}$   $ASD = \frac{3.16 \text{ mV}}{\sqrt{1 \text{ Hz}}}$

2(a) Which sampling format is used in commercial systems (i) flat top sampling or (ii) natural sampling? Explain why.

Flat-top: transmitter needs to send only one value, held by receiver for full duration. In natural Sampling, the value changes throughout the sample duration.

(b) A tapeless telephone answering machine records the outgoing message with 8 bit precision at an 8 kHz sampling rate.

(i) How many bytes of memory are required to store a 20 second message?

$$8 \text{ kHz} \cdot 20 \text{ s} = 160,000 \text{ bytes}$$

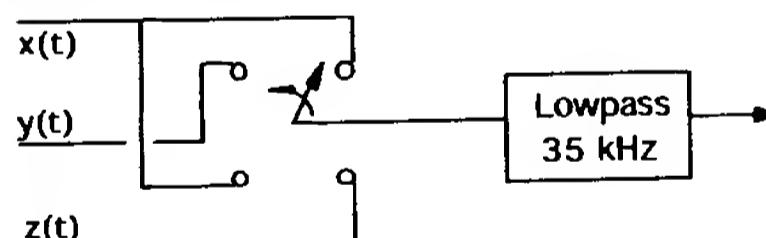

(ii) When playing the outgoing message, stored samples are placed in a digital latch which is connected to an A/D converter followed by an analog lowpass filter. Does this system implement natural or flat top sampling?

Flat-top  $\rightarrow$  Latch holds digital value

(iii) How can the latch in part (c) be operated to generate 50% duty cycle samples? What would be the advantage of this?

Latch must hold for  $\frac{0.5}{8000} = 62.5 \mu\text{s}$ . Then drop to zero for 62.5  $\mu\text{s}$ . The advantage would be increased SNR

(c) A three channel PAM system carries signal  $x(t)$  which is bandlimited to 7 kHz, signal  $y(t)$  which is bandlimited to 5 kHz and signal  $z(t)$  which is bandlimited to 4 kHz. Determine the maximum and minimum pulse rate on the transmission line such that all three signals can be reconstructed without distortion.

Min rate  
10 kHz (theoretical)

11.5 kHz (practical)

Max Rate  
70 kHz (theoretical)

61 kHz (practical)

$$10^4 \cdot \frac{7 \text{ kHz}}{2} = 35 \text{ kHz}$$

$$2.512 \text{ kHz} \cdot \text{constant} = 10 \text{ kHz}$$

$$2.286 \text{ kHz} \cdot 70 \text{ kHz}$$

$$70 \cdot 10\%$$

3(a) What is the peak to rms ratio of a squarewave and a sinewave?

1:1 Square  
Peak:RMS  
 $\frac{1}{\sqrt{2}}$  Sinewave

(b) Determine, from first principles, the peak to rms ratio of a triangular waveform. (Note - integration is required)

$$P_{\text{RMS}} = \frac{1}{T} \int_{T/2}^{3T/2} \left( \frac{A}{T} t \right)^2 dt$$

$$= \frac{1}{T} \int_{T/2}^{3T/2} \frac{A^2}{T^2} t^2 dt$$

$$= \frac{A^2}{T} \int_{T/2}^{3T/2} t^2 dt$$

$$= \frac{A^2}{T} \left[ \frac{t^3}{3} \right]_{T/2}^{3T/2}$$

$$= \frac{A^2}{T} \left[ \frac{(4A)^3}{3} - \frac{(2A)^3}{3} \right]$$

$$= \frac{A^2}{T} \left[ \frac{64A^3}{3} - \frac{8A^3}{3} \right]$$

$$= \frac{A^2}{T} \cdot \frac{56A^3}{3}$$

$$= \frac{56A^5}{3T}$$

$$= \frac{56A^5}{3 \cdot 2A} = \frac{28A^4}{3}$$

$$= \frac{28A^4}{3} \cdot \frac{1}{A^2} = \frac{28A^2}{3}$$

$$= \sqrt{\frac{28A^2}{3}} = \sqrt{\frac{28}{3}} A$$

$$= \sqrt{\frac{28}{3}} = \sqrt{8.67} = 2.94$$

$$= \frac{A}{\sqrt{2}} = \frac{A}{\sqrt{2}}$$

(c) A 10 bit uniform quantizer has voltage range  $\pm 1.024$  volts.

(i) What is the bin size in mV?

$$2048 \cdot \frac{1}{10} = 204.8 \text{ mV}$$

(ii) What is the quantizing SNR of a (1/4 load) sinewave with peak-to-peak voltage 512 mV?

$$P_s = \frac{(0.512)^2}{2} = 132.768 \text{ mW}$$

$$P_n = \frac{204.8^2}{12} = 0.33 \text{ mW}$$

$$\text{SNR} = \frac{132.768}{0.33} = 400 \text{ dB}$$

(iii) What is the quantizing SNR of a complex waveform with peak-to-peak voltage 512 mV and peak-to-rms ratio equal to 5?

$$\frac{P_s}{P_n} = \frac{\left(\frac{512}{2}\right)^2}{\frac{204.8^2}{12}} = \frac{12(655.36)}{204.8^2} = 10 \log_{10}(12 \cdot 655.36) = 38.96 \text{ dB}$$

(d) For the above quantizer, operating at 44.1 kHz, a full load sinewave will have normalized power  $P_s = (1.024)^2/2 = 524 \text{ mW}$ .

(i) Determine the total quantizing noise power  $P_n$  and calculate  $10 \log_{10}(P_s/P_n)$

$$P_n = \frac{204.8^2}{12} \Rightarrow 10 \log_{10} \left( \frac{524}{\frac{204.8^2}{12}} \right) = 61.77 \text{ dB}$$

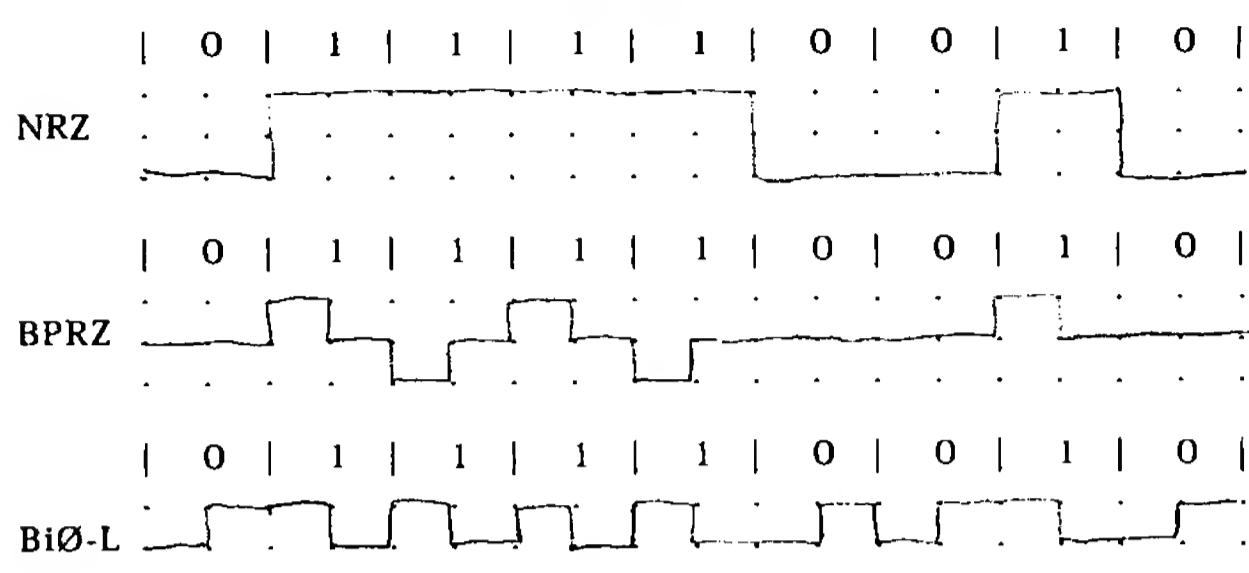

(ii) Determine the quantizing noise power in the frequency range 0 - 20 kHz if 100% flat top sampling is used and sin x/x correction has been applied at the system output.

$$\text{SNR} = 6.02(10) \cdot 1.77 \cdot 10^{10} \cdot \left( \frac{44.1 \cdot 10^3}{20 \cdot 10^3} \right) = 62.4 \text{ dB}$$

(iii) Determine the quantizing noise power in the frequency range 0 - 20 kHz if the sampling rate is increased by a factor of 8.

$$\text{SNR} = 6.02(10) \cdot 1.77 \cdot 10^{10} \cdot \left( \frac{44.1 \cdot 10^3}{20 \cdot 10^3} \right)^2 = 71.4 \text{ dB}$$

4. (a) Illustrate non-return to zero (NRZ), alternate mark inversion bipolar return to zero (BPRZ) and biphasic level (BiØ-L) coding for the following binary sequence.

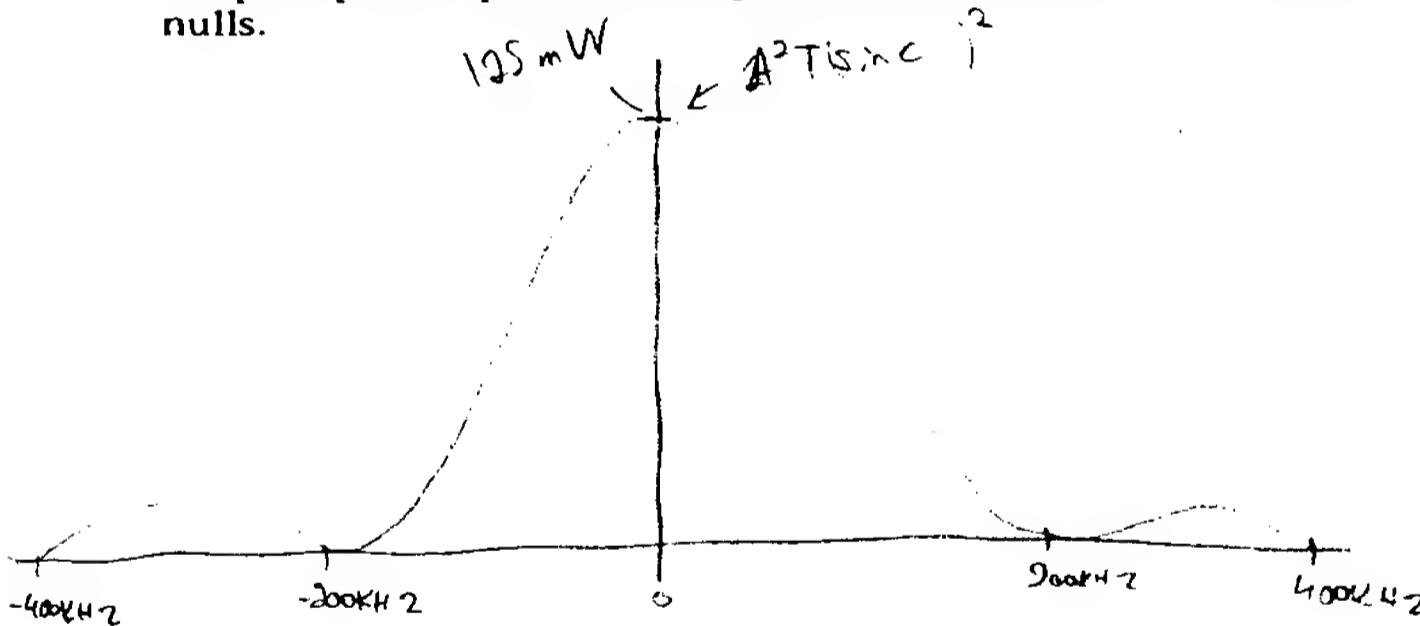

(b) Random data is transmitted using NRZ coding, 200 kb/s rate and  $\pm 5$  volt amplitude.

i) Calculate the normalized power in the data signal.

$$P_d = S^2 = 25W$$

$$S = V_{rms}$$

ii) Sketch the power spectrum on a 2 sided frequency scale and indicate the peak power spectral density and the frequency of any spectral nulls.

iii) Estimate the data signal power in the audio bandwidth of 20 Hz -20 kHz through (approximate) integration of the power spectral density.

$$125 \text{ mW} \cdot 20000 \text{ Hz} \\ = 2.5 \text{ W}$$

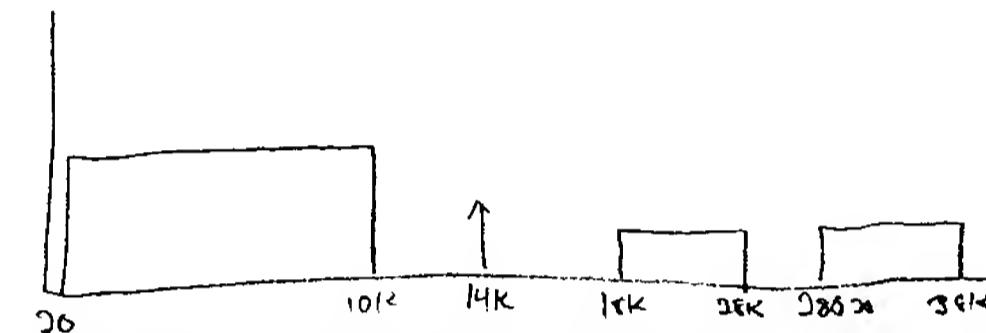

5. Assume that two audio signals with constant amplitude spectral density from 20 Hz to 10 kHz are to be multiplexed into one composite signal using a method similar to FM and TV stereo. One of the signals remains at baseband while the other signal is sent using DSB-SC modulation. Note that a pilot tone at one half the carrier frequency is transmitted and used to synthesize a receiver carrier for DSB-SC demodulation.

(a) What is the result of demodulation with 45 degree receiver carrier phase error and with 90 degree phase error?

Demodulation with  $45^\circ$  degree error  $\rightarrow \cos 45^\circ = 0.707$

$90^\circ \rightarrow 0$  output  $\Rightarrow \cos 90^\circ = 0$

(b) Assuming that the pilot frequency is 14 kHz, sketch the one sided composite signal spectrum and indicate all important frequencies.

(c) Why is the pilot tone NOT sent at the DSB-SC carrier frequency?

must be selected, filtered, and amplified. Ease of filter construction

(d) What would be the advantage and disadvantage of using a pilot frequency of 11 kHz?

Hard to extract carrier from narrow range  
Less Bandwidth required

(e) The pilot tone is generated from the DSB-SC carrier at the transmitter by using a frequency divide by two (counter) circuit. The receiver carrier is generated from the pilot tone by using a multiply frequency by two logic circuit (a transition detector is one method). Illustrate waveforms for pilot signal generation and carrier regeneration and explain how the receiver carrier can be synthesized with the same phase as the transmitter carrier.

6 (a) A television receiver is tuned to channel 6 which has video carrier at 83.25 MHz and audio carrier at 87.75 MHz. The TV uses a superheterodyne receiver with video IF at 45.75 MHz and sound IF at 41.25 MHz.

(i) What is the local oscillator frequency when tuned to channel 6?

$$L_O = 83.25 + 45.75 \\ = 129 \text{ MHz}$$

(ii) What are the video and sound image frequencies?

$$\text{Video} \rightarrow 129 + 45.75 = 174.75 \text{ MHz} \\ \text{Sound} \rightarrow 129 + 41.25 = 170.25 \text{ MHz}$$

(iii) Repeat i) for a sub-heterodyne receiver with the same IF frequencies. Do you see any problems?

$$\text{i) } L_{O_{\text{vid}}} = 83.25 - 45.75 = 37.5 \text{ MHz} \\ L_{O_{\text{aud}}} = 87.75 - 41.25 = 46.5 \text{ MHz} \\ \text{Not Same}$$

(b) An AM transmitter is tested with a dummy resistive load. The modulated output is expressed as  $\phi(t) = [1 + \mu m(t)] A_c \cos \omega_c t$  where  $m(t)$  is the program signal with zero average value and  $m_p = 1.0$ . With no modulation,  $m(t) = 0$ , the output power is 10 kW. Typical programming signals have peak/rms ratio of 4. The modulation index is set at 85% (i.e.  $\mu m_p = 0.85$ ). Find the average transmitter power when a program signal is broadcast.

$$\langle m^2(t) \rangle = \frac{(0.85)^2}{0.4^2} = 0.045156 \quad \frac{(A_c)^2}{2} = 1000 \\ A_c = 141.4 \text{ V}$$

$$P_{av} = (1 + \langle m^2(t) \rangle)^2 \frac{A_c^2}{2} = (1 + 0.045156) \frac{(141.4)^2}{2} \\ = \boxed{10.45 \text{ kW}}$$

END
